Abstract

Extensible Markup Language (XML) is fast emerging as the domain standard for representing data in the World Wide Web. Xpath is a l;anguage for addressing, structural parts of an XML docvuments. The Xpath language is desinged to be broadly applicable across all type of XML data sources. In this system, the concept of XML database and XML Path Language can be applied. Any user can search and view details of the computer information in this system. The system automatically generates Xpath query according to the usr input and the desired computer results can be expressed by processing this query. The administrator can add, updateand delete computer information by applying Xpath technology.
